This book constitutes the 25th International Conference on Infrastructure and Environment (infraeco 2018) that focuses on rural problems connected with infrastructural equipment. In general, infrastructure issues are dedicated to urban areas while rural topics are linked to agriculture so this conference bridges these two aspects. It also explores ways to manage and separate conflicts between different and important needs of inhabitants, the environment, and other spatial users. The conference provides a forum for much needed cooperation between various scientific disciplines regarding these multidisciplinary problems and issues; hence, Infraeco 2018 draws together engineers, planners, consultants, land developers, and academics from across all disciplines of highway planning, design, operations, and engineering to presents effective practices and share current research results.

Post-crisis Growth and Development lays the groundwork for setting development priorities and advances the discussion among the G20, and non-G20 countries on development policy in infrastructure, trade, food security, financial inclusion, and Millennium Development Goals (MDGs), as they relate to strong, sustainable, and balanced global growth.

China's Belt and Road Initiative (BRI) is expected to be the largest infrastructure development scheme of the twenty-first century. There is escalating concern over BRI's potential environmental impacts in Southeast Asia, a global biodiversity hotspot and a focus area of BRI development. Case studies of Indonesia, Myanmar, Lao PDR and Malaysia show that the success of BRI in bringing about sustainable growth and opportunities depends on the Chinese government and financiers, as well as the agencies and governments involved when BRI investments take place. The adoption of best environmental practices is critical in ensuring that growth is sustainable and that bad environmental practices are not locked in for decades to come.

Throughout the world there is a growing demand for high quality public services to support socio-economic development. Infrastructure is central to improving the level of public services and the quality of the built environment. But in key areas such as transport, energy, water, healthcare, education and communications, public resources are not sufficient to keep pace with this demand. As the public sector struggles to keep up, the private sector is increasingly involved in the procurement of economic and social infrastructure. Until now procurement strategies have often concentrated on the mechanisms and the 'bricks and mortar' without a thorough analysis of the processes and their implications for services. The result is that all too often infrastructure projects are implemented in an ad hoc and fragmented way. In this ground-breaking book, Rodney Howes and Herbert Robinson provide a holistic approach to infrastructure provision that facilitates infrastructure delivery aimed at continuously improving the level and quality of services. Critical issues of policy and strategy, implementation, and operational aspects are examined within the context of sustainability. By emphasising the importance of procuring infrastructure within an overall national or regional development policy and strategy, the authors have demonstrated the importance of linking investment and resource decisions to local social, economic and environmental needs. With each chapter carefully written to reflect part of the infrastructure delivery chain and illustrated with practical examples and case studies from around the world, this book offers a new blueprint for infrastructure investment and resource management.
