We can draw exactly one line through two points. All points on the same line are called collinear. Two lines are either parallel or they will intersect at a point. A line segment is part of a line with two end points. A ray starts from one end point and extends in one direction forever. A plane is a flat 2-dimensional surface. It can be identified by 3 points in the plane. There are infinite number of lines in a plane. The intersection of two planes is a line.

Given any two points, you can draw exactly one line that passes through both of them. In other words, two points determine a line. When two lines intersect, they share a single point. When two lines don ' t intersect, they are parallel, which means that they remain the same distance from each other everywhere.

A point in geometry is a location. It has no size i.e. no width, no length and no depth. A point is shown by a dot. A line is defined as a line of points that extends infinitely in two directions. It has one dimension, length. Points that are on the same line are called collinear points.

Points, lines and planes underpin almost every other concept in geometry. Angles are formed between two lines starting from a shared point. Shapes, whether two-dimensional or three-dimensional, consist of lines which connect up points. Planes are important because two-dimensional shapes have only one plane; three-dimensional ones have two or more.
